Ivan Yurkin

React Native Engineer – Mobile & Web (TypeScript, React)

React Native engineer with 5 years shipping production mobile apps in TypeScript, including 3+ years on a regulated crypto/fintech platform. There I built the IBAN and card flows, the compliance system architecture, native iOS modules, and migrated about 220 screens and modals.
Experience building apps from scratch, working directly with backend and product, and prototyping features myself when there is no designer.
Background also spans web (React, Vue, Angular) and Backend (Django, Python) from university and personal projects.

EXPERIENCE

Nash.io // Frontend Developer

Non-custodial cryptocurrency exchange and platform offering trading, payment services, and digital asset management.

March 2023 - June 2026 (3 years 4 months)

- Built the ModulR/IBAN banking integration (account funding, transfers, card issuance) – worked against incomplete/mid-transition designs, improvising UX where specs were missing, and integrated the full GraphQL surface with backend
- Worked on native modules, e.g. CryptoModule for secure debit card data reveal (RSA-4096 key pair, AES token decryption) from scratch, researching key parsing and encryption/decryption with no prior cryptography experience
- Designed and built the compliance system architecture to eliminate race conditions, plus a feature-availability interface used across the app to gate features – working directly with backend to ship it
- Migrated the app off a legacy custom navigation system to a typed React Navigation architecture (Stack/Modal/Bottom Tab) – about 220 screens and modals
- Consolidated scattered deep-link handling across the app into a single LinkAgent service improving maintainability and reliability of link/state restoration
- Designed features in code alongside product (e.g., Contacts, Earn) when the team had no dedicated designer – prototyping directly in React Native and iterating with the team over screenshots
- Built UI and API integration for Contacts (including Contacts V2: friends, chats and seamless transactions inside chat windows), Automations, Earn, Price Alerts and other in-app features
- Migrated from legacy MobX stores to Redux Toolkit + redux-persist as part of an ongoing architecture modernization effort
- Co-wrote and ran the team's Maestro e2e suite (KYC, compliance, IBAN, trading, Earn and other flows): wrote some flows, fixed others, refactored shared configs for reuse across the main flows, ran the full suite before every release and reported the results to the PM
- Maintained parts of the GitLab CI/CD and Fastlane setup and worked with Jest unit tests covering core functions
- Worked in a small frontend team with daily code review in both directions, and with backend on GraphQL schema design across most features above. Independently designed GraphQL schemas for integration into the application.
- Proactively identified and refactored technical debt as a daily practice — e.g., rewrote a broken payment modal from scratch instead of just patching it — recognized by the team for code quality
- Nash Exchange & Nash Widget Monorepo Support – Web Platform (same company, separate web codebase from the mobile app)
  - Diagnosed and fixed display bugs in withdrawals and portfolio balances
  - Built compliance-adjacent flows for the fiat on/off-ramp: source-of-funds and occupation confirmation, sell quote flow
  - MiCA-related request improvements

Porttie // React Native Developer

Hotel booking app MVP. Sole React Native developer.

December 2022 – March 2023 (4 months)

- Bootstrapped the app from scratch – stack selection, project structure, navigation, and state management patterns
- Chose React Native with MobX, prioritizing shipping speed for a small, fast-moving MVP feature set
- Built the full data layer from scratch – network providers, DTO-to-domain model adapters, and MobX stores using dependency injection (tsyringe) with reactive state syncing
- Implemented map-based hotel search with dynamic radius calculation and clustering (supercluster, geo-viewport bounding box) – including a discriminated-union search flow supporting both region search and direct single-hotel lookup/deep-linking
- Integrated and heavily customized react-native-calendars for date-range/availability selection, coordinating with backend on the data contract for availability
- Reviewed designs with the team in Figma before implementation and contributed UX changes
- Set up react-native-appmetrica-yandex analytics and Sentry crash reporting

Take A Place // React Native Developer

Coworking-space booking app, published on the App Store and Google Play.

May 2022 – June 2023 (1 year 2 months)

- Built features across a multi-city coworking marketplace: multi-city rollout (added Saint Petersburg – city model, adapter, localization), a points/loyalty payment system, and a referral program
- Refactored the app's authorization flow
- Migrated lists to FlashList for performance
- Built subscriptions UI integrated with a card-based web view payment flow
- Implemented gesture-driven UI and animations using Reanimated and Gesture Handler
- Built a multi-criteria coworking filter system and map filters
- Fixed cross-platform bugs (Android map rendering, region restoration from local storage, working-hours modal, etc.)
- Shipped Reviews, Booking, Pages, Favorites, promo codes, and other user-facing features
- Localized the app with i18n (RU/EN)
- Helped with Firebase Cloud Messaging (push notifications), deeplinking, and analytics
- Worked with Gatsby based landing website and GraphQL
- Distributed the app to App Store and Google Play, used Ad Hoc for iOS test versions.

poVoenke // React Native Developer

iOS/Android mobile application for real-estate purchase, published on the App Store and Google Play.

March 2021 – March 2023 (2 years 1 month)

- Primary engineer on the Banks/Documents module for over a year – built bank onboarding, document upload/management, and file handling flows; worked on full redesigns of the Documents and Banks
- Refactored a legacy codebase into a maintainable component/store structure following React patterns
- Built local-first data layer with Realm – repository pattern with a generic AbstractArrayRepo, stale-while-revalidate loading (serve from local DB, then refresh from server) across Buildings, Banks, Contacts, and Calculator modules
- Reduced crash rate by triaging and fixing native crashes and long-tail bugs surfaced through Sentry
- Mentored a junior developer – code review, written feedback, and pairing calls
- Rebuilt UI for a full app redesign (new Figma design system) across Buildings, Calculator, and other modules, closing out with a Buildings redesign

EDUCATION

Moscow Polytech // BSc in Computer Science and Engineering (09.03.01)

2019 - 2023, Moscow

- Thesis: Mobile application for hotel booking
- Coursework: Web Development, Mobile Development, Databases, Algorithms, Information Security, Big Data, Machine Learning
- Completed Cisco Networking Academy
- Built numerous small and medium projects using React, Vue, Angular, Kotlin, Python, Django, Docker, SQL and PostgreSQL

PROJECTS

Hackathon Maff Metaverse Decentraland // Frontend Lead Developer

Metaverse development company.

Nov 2021 - Dec 2021 (1 month)

- Set up the team workflow in Trello
- Designed the game concept and project architecture
- Integration in Decentraland

University Project Fizruk // Frontend Lead Developer

Management system for the Department of Physical Education at Moscow Polytech University.

2022

- Led the frontend team and coached junior developers; built personal accounts for students (viewing) and teachers (managing students) in React, TypeScript, MobX, Styled Components.

Questeria // Personal project (in development)

Task and goal management app with a quest-like interface: quest boards, XP, hand-drawn sketches for each quest (PencilKit), offline-first with server sync

- Includes building my own ML model for sketch classification
- Full-stack: React Native, Nitro Modules, Realm, MobX, tsyringe; Python FastAPI, PostgreSQL
- Pixel-style UI built on my own component library, react-native-pixelkit

slice-driven-development-workflow // Personal project

A lightweight workflow for building features with an AI coding agent: one spec per feature, split into short slices that the agent implements one at a time and a human reviews as code.

- Markdown templates and agent rules (CLAUDE.md, spec and slice templates); GitHub

⌨️ Skills

TypeScript, JavaScript, Python, Kotlin, Swift, SQL

React, React Native, Redux/Redux Toolkit, MobX, GraphQL, Reanimated, Gesture Handler, Realm, HTML, CSS, SCSS, Styled Components, Gatsby

Native iOS module development (Swift), Fastlane, GitLab CI/CD, Maestro (E2E testing), Jest

Python, Django, FastAPI, PostgreSQL, SQL, Docker

💻 Tools

Visual Studio Code, IntelliJ IDEA, Android Studio, Xcode, Flipper

Figma, Aseprite

Notion, Slack, Obsidian, Linear, ClickUp, Trello

Claude Code, Local models

🌐 Languages

Russian (native), English (B2, Upper Intermediate)
